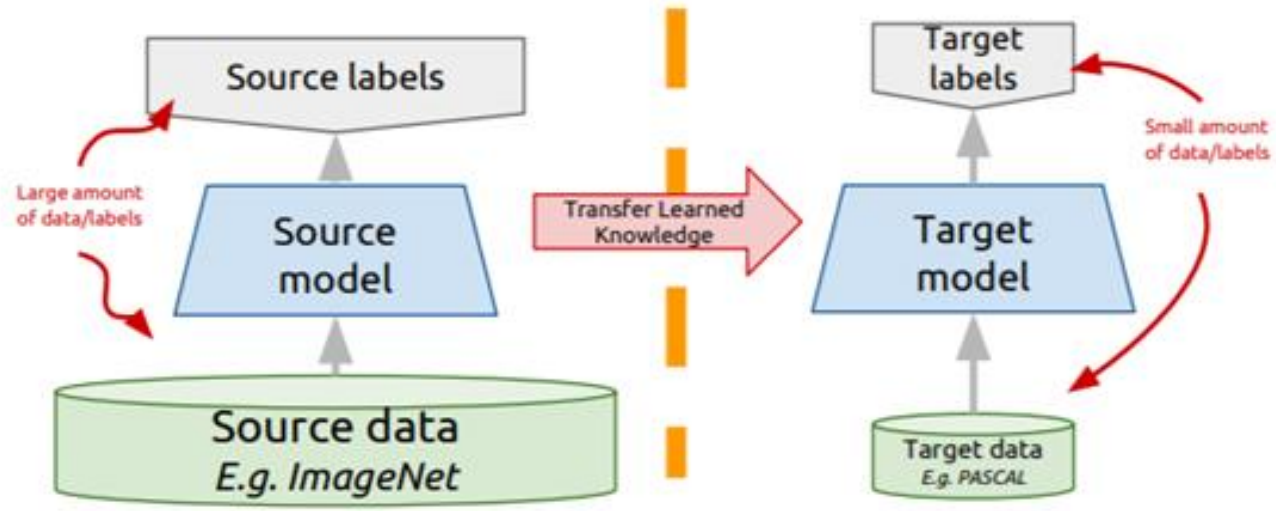
Transfer learning: idea

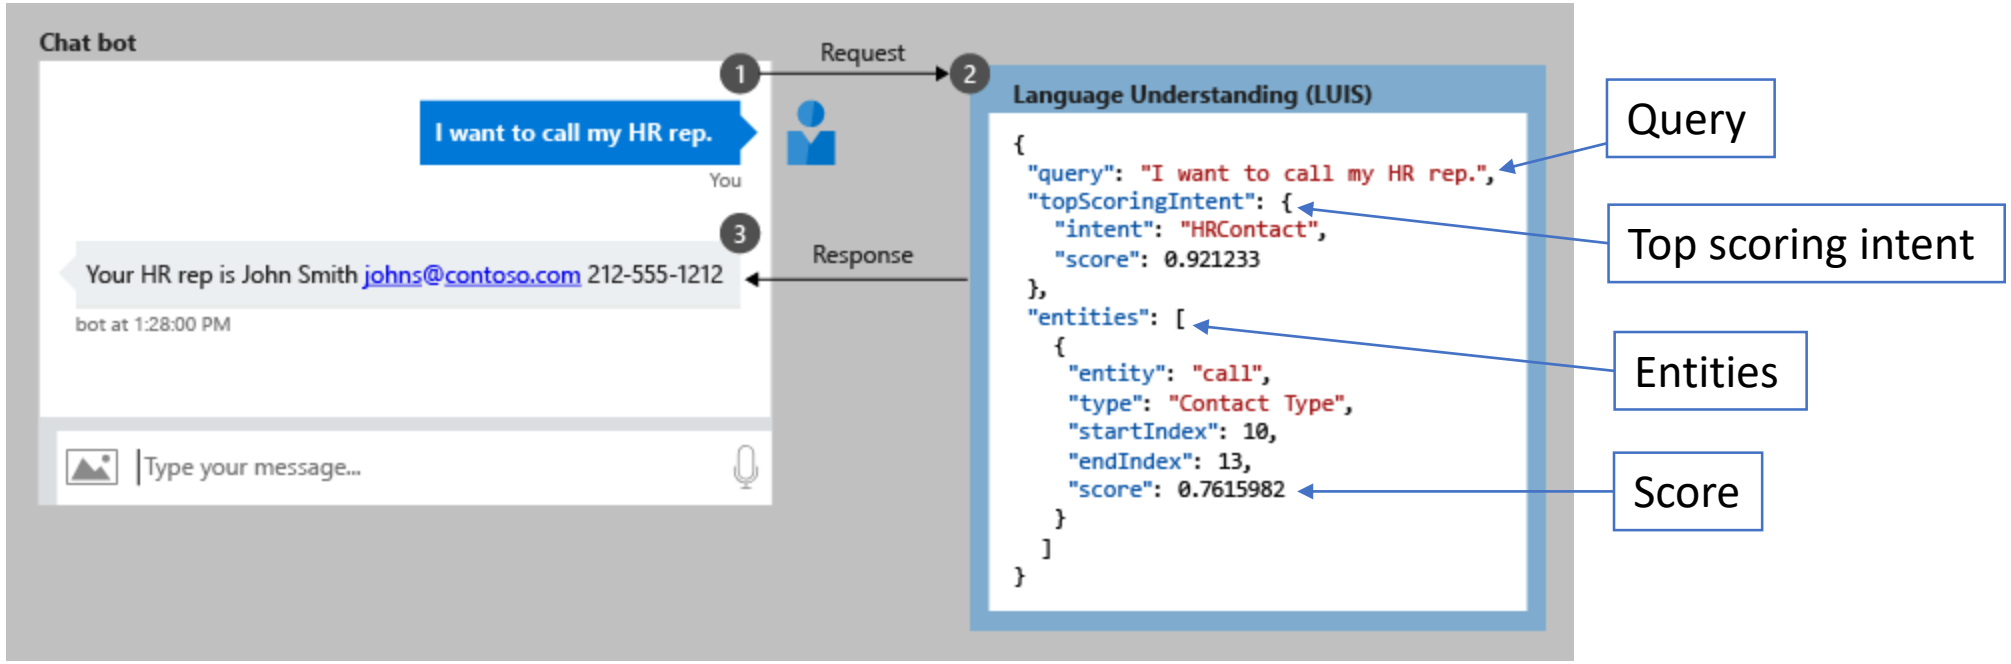
Instead of training a deep network from scratch for your task:

- Take a network trained on a different domain for a different **source task**
- Adapt it for your domain and your **target task**

Variations:

- Same domain, different task
- Different domain, same task



Azure Language understanding (LUIS)


- Utterances - Text sent by the user (query).
  Example: Book a flight to Seattle in Saturday.
- Intents - An intent represents a task or action the user wants to perform.
  Example: Book a flight.
- Entities - The entity represents a word or phrase inside the utterance that you want extracted.
  Example: Seattle, Saturday.
